Aviation Noise Impacts Roadmap Annual Meeting,  
19-20 April 2011

# Overview

- Problem Statement
- Overview of New Findings
- Question Set-up
- Question Asked

# Problem Statement

## New generation fighter aircraft

- ✦ Increased thrust
- ✦ Significant noise levels
- ✦ Complex nozzles
- ✦ Dynamic directivity

*Also remember that*

## Old generation commercial jets

- ✦ Turbojet engines
- ✦ Low by-pass
- ✦ High thrust
- ✦ 20+ dB louder than current generation

# First, a Few Comments

## Nonlinearities in Jet Noise

Pestorius and Blackstock (1974), broadband spectrum:

Energy is moved to both low AND high frequency:

### ★ **Waveform steepening**

➤ *Energy is transferred towards high-frequency range*

### ★ **Shock coalescence**

➤ *Energy is transferred towards low-frequency range*

★ *Use statistics to identify and quantify nonlinear propagation effects in the **pressure waveforms**.*

# Nonlinearity and Jet Noise

- Static field test carried out in 2004 on F-22 Raptor
- Measured data and nonlinear prediction both show shock wave formation and spectral energy transfer
- The shock waves are very audible – “crackly.”

# Nonlinearity and Jet Noise

- ★ Static field test carried out in 2004 on F-22 Raptor
- ★ Measured data and nonlinear prediction both show shock wave formation and spectral energy transfer
- ★ The shock waves are very audible – “crackly.”

# Nonlinearity and Jet Noise

- Static field test carried out in 2004 on F-22 Raptor
- Measured data and nonlinear prediction both show shock wave formation and spectral energy transfer
- The shock waves are very audible – “crackly.”

23-305 m Nonlinear Prediction

305 m Measurement

23-305 m Linear Prediction

# Calculating Nonlinearity Impact

Do you expect differences in metrics?

<b>Metric</b>	<b>Measured at 305 m (dB)</b>	<b>Nonlinear Prediction (dB)</b>	<b>Linear Prediction (dB)</b>
<b>OASPL-Flat</b>	<b>121.8</b>	<b>119.9</b>	<b>120.3</b>
<b>OASPL-A</b>	<b>111.0</b>	<b>111.4</b>	<b>110.2</b>
<b>OASPL-C</b>	<b>121.5</b>	<b>119.6</b>	<b>120.2</b>
<b>Mark VII PL</b>	<b>118.1</b>	<b>117.6</b>	<b>115.9</b>

# Calculating Nonlinearity Impact

Do you expect differences in metrics?

<b>Metric</b>	<b>Measured at 305 m (dB)</b>	<b>Nonlinear Prediction (dB)</b>	<b>Linear Prediction (dB)</b>
<b>OASPL-Flat</b>	<b>121.8</b>	<b>119.9</b>	<b>120.3</b>
<b>OASPL-A</b>	<b>111.0</b>	<b>111.4</b>	<b>110.2</b>
<b>OASPL-C</b>	<b>121.5</b>	<b>119.6</b>	<b>120.2</b>
<b>Mark VII PL</b>	<b>118.1</b>	<b>117.6</b>	<b>115.9</b>

# Calculating Nonlinearity Impact

Do you expect differences in metrics?

Metric	Measured at 305 m (dB)	Nonlinear Prediction (dB)	Linear Prediction (dB)
OASPL-Flat	121.8	119.9	120.3
OASPL-A	111.0	111.4	110.2
OASPL-C	121.5	119.6	120.2
Mark VII PL	118.1	117.6	115.9

Not what I expected based on my ear

Recordings clearly show that the nonlinearity ‘sounds’ louder: Listen to waveforms embedded in: K. L. Gee, S. H. Swift, V. W. Sparrow, K. J. Plotkin, and J. M. Downing, “[On the potential limitations of conventional sound metrics in quantifying perception of nonlinearly propagated noise](#),” J. Acoust. Soc. Am. **121**, EL1-EL7 (2007).

Additional explorations with time-varying loudness, successful with sonic booms, have proved unfruitful (See Swift and Gee, J. Acoust. Soc. Am., in press (2011).)

# Potential Physical Nonlinear Metrics

How do we quantify these effects?

## Physical Aspects

- ★ *Basic: Lmax, Leq, A-wt, C-wt, etc.*
- ★ **Statistical: Skewness & Kurtosis**
  - Pressure
  - Pressure time derivative
- ★ **Morfey-Howell Indicator**

$$Q_{p^2p}(f) = \text{Im} \left[ FT \{ p^2(t) \} FT^* \{ p(t) \} \right]$$

$$Q/S(f) = \frac{Q_{p^2p}(f)}{P_{rms} S_{pp}(f)}$$

# Are you still with me?

## Military jets

- ✦ Low by-pass engines + high thrust = high velocity and high acoustic amplitudes
- ✦ High amplitude acoustic waveforms create shocks & nonlinearity
- ✦ Nonlinear propagation creates “crackle”
- ✦ Subjectively “louder” waveforms for similar overall SPL levels
- ✦ So now my question ....

# So now my question:

What is the character of aircraft noise included in social surveys in the Schultz curve and following studies?

# Some Background on Aircraft Noise

- ✦ 1969 – FAA 14 CFR part 36
  - ✦ “Noise Standards: Aircraft Type Certifications”
- ✦ 1973 – Stage designation for newly produced aircraft
- ✦ 1977 – Stage 3 noise limits introduced
- ✦ 1985 – 4 engine Stage 1 aircraft banned
- ✦ 2000 – All Stage 3

# Schultz Data 1978

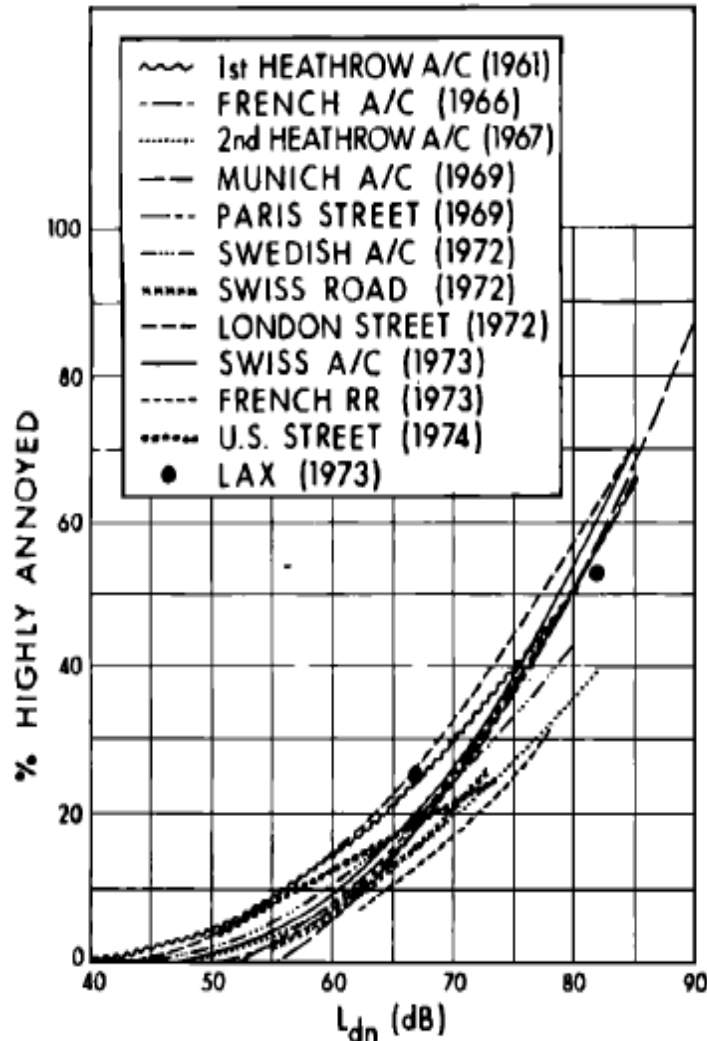

FIG. 2. Revised analysis of the clustering surveys using a rule for counting the percent highly annoyed that leaves out personal judgment in the individual surveys.

# Miedema & Vos 1998

## Reanalysis suggests differences between modes of transportation

air

road

rail

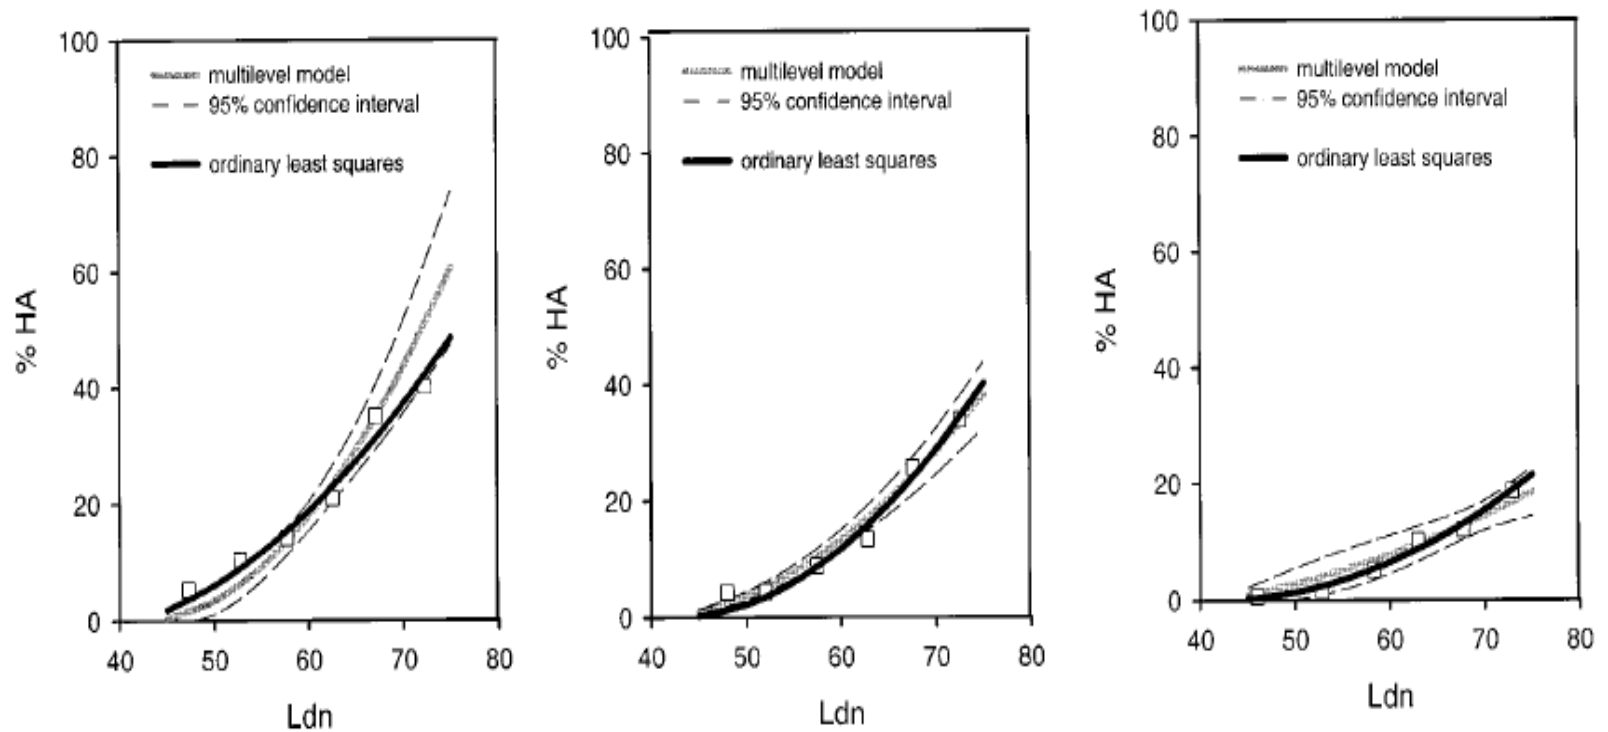

FIG. 3. Percentage highly annoyed persons (%HA) as a function of DNL. Two synthesis curves per mode of transportation, and the datapoints are shown. For the curves obtained with multilevel analysis the 95% confidence intervals are shown.

# Aircraft Noise Surveys

▲	FRA-016	French Four-Airport Noise Study	(1965)
▲	UKD-024	Heathrow Aircraft Noise Survey	(1967)
▲	USA-022	U.S.A. Four-Airport Survey (phase 1 of Tracor Survey)	(1967)
▲	USA-032	U.S.A. Three-Airport Survey (phase II of Tracor Survey)	(1969)
▲	SWE-035	Scandinavian Nine-Airport Noise Study	(1969-72,74,76)
▲	USA-044	U.S.A. Small City Airports (small City Tracor Survey)	(1970)
▲	SWI-053	Swiss Three-City Noise Survey	(1971)
▲	USA-082	LAX Airport Noise Study	(1973)
▲	USA-203	Burbank Aircraft Noise Change Study	(1979)
▲	CAN-168	Canadian National Community Noise Survey	(1979)

# Analysis of Old Commercial Jet Noise

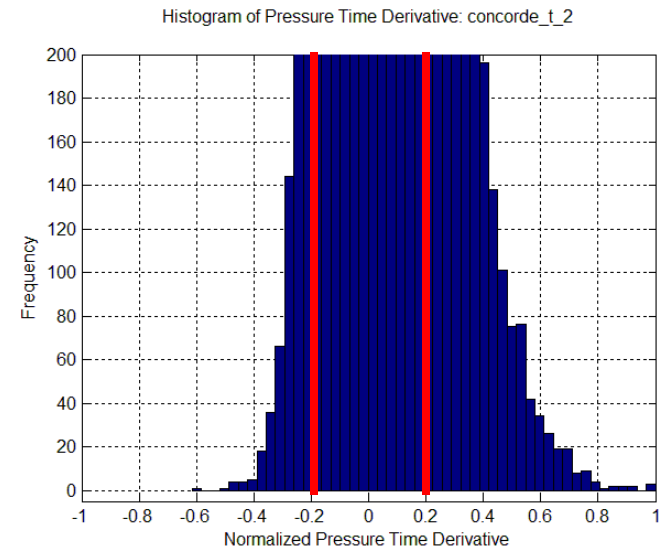

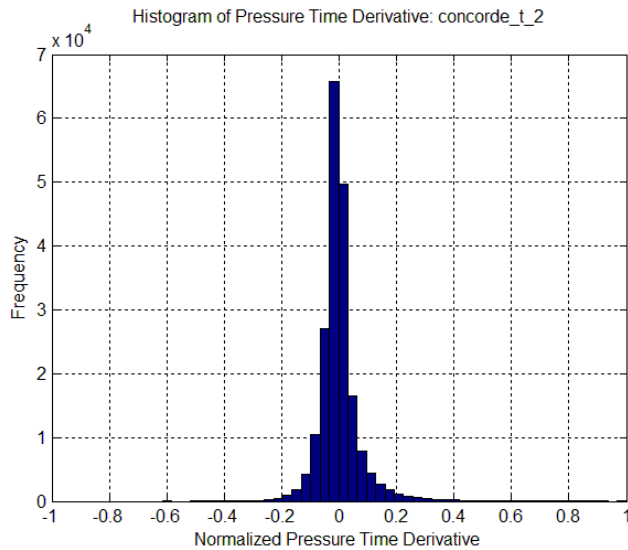

- ✦ Hard to get good data on old aircraft
  - ✦ Dynamic range of instrumentation
  - ✦ Medium of storage
  - ✦ (So, thanks David Dubbink)
- ✦ Three examples:
  - ✦ Concorde departure
  - ✦ 727 departure
  - ✦ 757 departure

# Analysis of Old Commercial Jet Noise

## Concorde

### Distribution of Normalized Pressure Time Derivative

Skewness 2.9

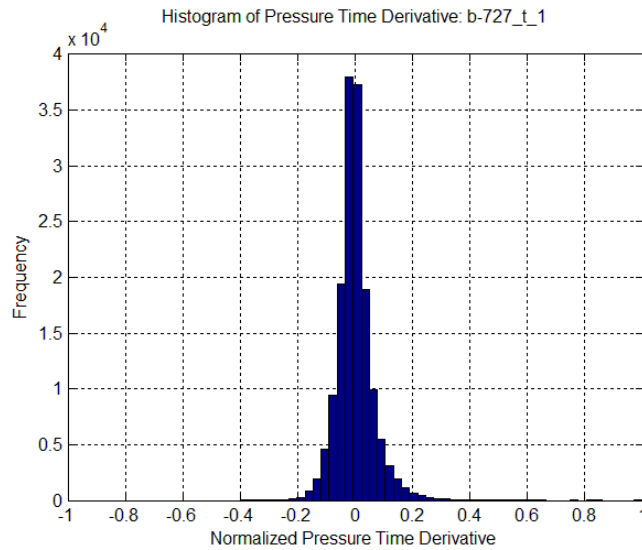

HMI

## 727

### Distribution of Normalized Pressure Time Derivative

Skewness 1.2

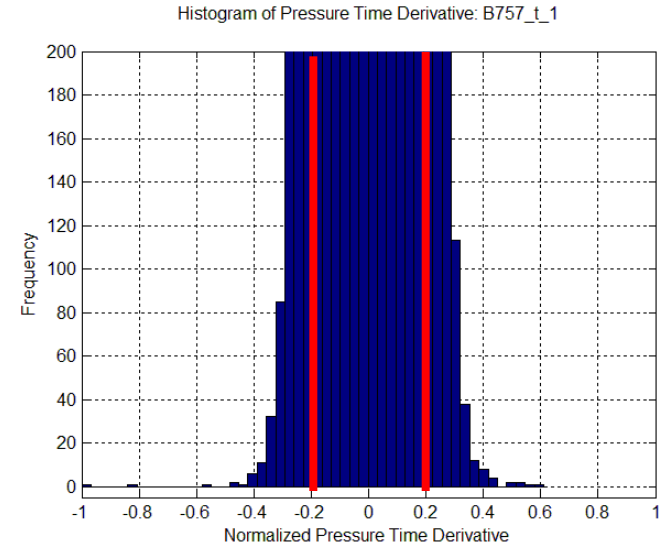

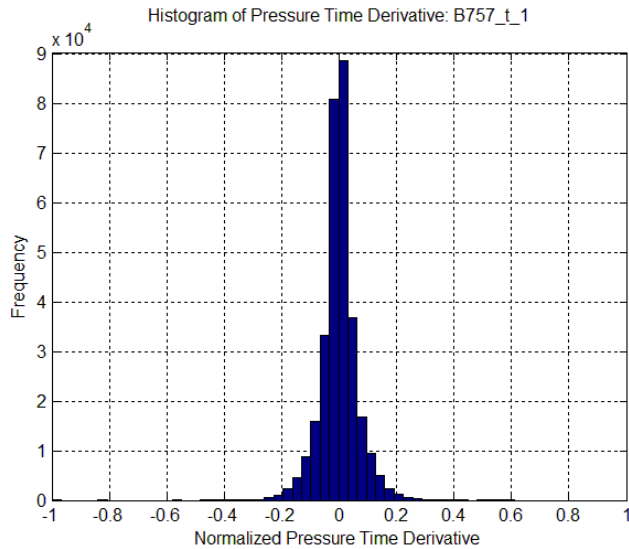

HMI

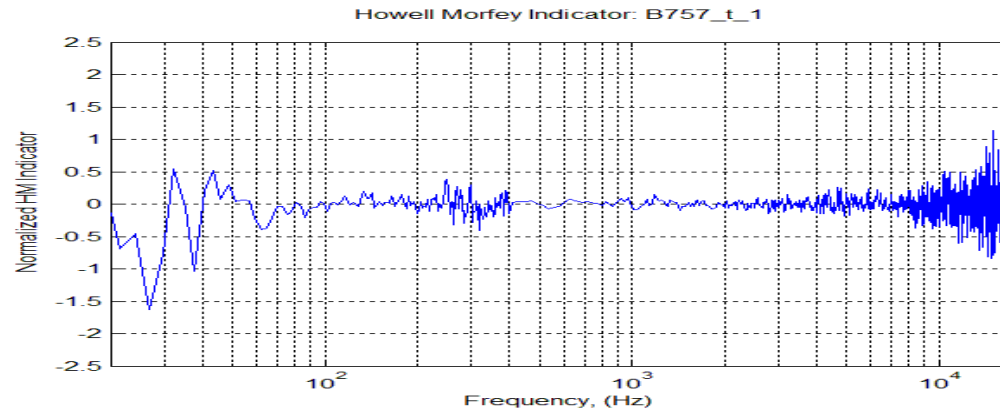

## 757

### Distribution of Normalized Pressure Time Derivative

Skewness 0.0

HMI

# Wrap – Up & Question

- ▶ High amplitude jet noise
  - ◆ Nonlinear propagation effects
  - ◆ Shocks generate subjectively “louder” events
- ▶ Spectra-based metrics do not capture perceived loudness
- ▶ Old commercial aircraft noise seem to contain “crackle”
- ▶ Social surveys mainly involved old aircraft
- ▶ Does this explain difference noted by Miedema & Vos?

# Wrap – Up & Question

- ▲ High amplitude jet noise
  - ◆ Nonlinear propagation effects
  - ◆ Shocks generate subjectively “louder” events
- ▲ Spectra-based metrics do not capture perceived loudness
- ▲ Old commercial aircraft noise seem to contain “crackle”
- ▲ Social surveys mainly involved old aircraft
- ▲ Does this explain difference noted by Miedema & Vos?
- ▲ **If so, should we adjust Schultz curve to better correlate with today’s commercial aircraft that do not have “crackle”?**

# Questions

Thank you for listening
